Using AI Factsheets for AI Governance

Last updated: Apr 30, 2026

Track a machine learning model from request to production by gathering metadata and facts about the model lifecycle using AI Factsheets. Use the detailed information in the factsheets to keep stakeholders informed and to meet your governance and compliance goals. Factsheets can be shared, archived, or printed as report.

Managing governance with AI Factsheets

Before you develop and AI solution you must first define the business use case and then manage the development, testing, and deployment of the solution. You can manage and govern the flow of information by create a model use case, that defines the goals of the model. When the model is approved and development starts, track the assets in the use case, capturing all relevant data with AI Factsheets. View at a glance which models are in production and which need development or validation. Use the governance features to establish processes to manage the communication flow from data scientists to ModelOps administrators.

Note: Only the models that you add to use cases are tracked
